

**NAME**

TAP::Parser::Scheduler::Spinner - A no-op job.

**VERSION**

Version 3.17

**SYNOPSIS**

```
use TAP::Parser::Scheduler::Spinner;
```

**DESCRIPTION**

A no-op job. Returned by `TAP::Parser::Scheduler` as an instruction to the harness to spin (keep executing tests) while the scheduler can't return a real job.

**METHODS****Class Methods****new**

```
my $job = TAP::Parser::Scheduler::Spinner->new;
```

Returns a new `TAP::Parser::Scheduler::Spinner` object.

**is\_spinner**

Returns true indicating that is a 'spinner' job. Spinners are returned when the scheduler still has pending jobs but can't (because of locking) return one right now.
