## DESCRIPTION

This class is of interest to people writing a Pod processor/formatter.

This class takes Pod and parses it, returning a parse tree made just of arrayrefs, and hashrefs, and strings.

This is a subclass of *Pod::Simple* and inherits all its methods.

This class is inspired by XML::Parser's "Tree" parsing-style, although it doesn't use exactly the same LoL format.

## METHODS

At the end of the parse, call `$parser->root` to get the tree's top node.

### Tree Contents

Every element node in the parse tree is represented by an arrayref of the form: [ *elementname*, \%attributes, ...subnodes... ]. See the example tree dump in the Synopsis, above.

Every text node in the tree is represented by a simple (non-ref) string scalar. So you can test

`ref($node)` to see whether you have an element node or just a text node.

The top node in the tree is [ 'Document', \%attributes, ...*subnodes*... ]
