

## NAME

README.haiku - Perl version 5.10+ on Haiku

## DESCRIPTION

This file contains instructions how to build Perl for Haiku and lists known problems.

## BUILD AND INSTALL

The build procedure is completely standard:

```
./Configure -de
make
make install
```

Make perl executable and create a symlink for libperl:

```
chmod a+x /boot/common/bin/perl
cd /boot/common/lib; ln -s perl5/5.12.2/BePC-haiku/CORE/libperl.so .
```

Replace 5.12.2 with your respective version of Perl.

## KNOWN PROBLEMS

The following problems are encountered with Haiku revision 28311:

- Perl cannot be compiled with threading support ATM.
- The `ext/Socket/t/socketpair.t` test fails. More precisely: the subtests using datagram sockets fail. Unix datagram sockets aren't implemented in Haiku yet.
- A subtest of the `ext/Sys/Syslog/t/syslog.t` test fails. This is due to Haiku not implementing `/dev/log` support yet.
- The tests `lib/Net/Ping/t/450_service.t` and `lib/Net/Ping/t/510_ping_udp.t` fail. This is due to bugs in Haiku's network stack implementation.

## CONTACT

For Haiku specific problems contact the HaikuPorts developers: <http://ports.haiku-files.org/>

The initial Haiku port was done by Ingo Weinhold <[ingo\\_weinhold@gmx.de](mailto:ingo_weinhold@gmx.de)>.
