

## NAME

`autodie::exception::system` - Exceptions from autodying `system()`.

## SYNOPSIS

```
eval {  
    use autodie qw(system);  
  
    system($cmd, @args);  
  
};  
  
if (my $E = $?) {  
    say "Oops! ", $E->caller, " had problems: $@";  
}
```

## DESCRIPTION

This is a *autodie::exception* class for failures from the `system` command.

Presently there is no way to interrogate an `autodie::exception::system` object for the command, exit status, and other information you'd expect such an object to hold. The interface will be expanded to accommodate this in the future.

## stringify

When stringified, `autodie::exception::system` objects currently use the message generated by *IPC::System::Simple*.
