

NAME

CPANPLUS::Internals::Source::Memory - In memory implementation

\$cb->__memory_retrieve_source(name => \$name, [path => \$path, uptodate => BOOL, verbose => BOOL])

This method retrieves a *storabled* tree identified by \$name.

It takes the following arguments:

name

The internal name for the source file to retrieve.

uptodate

A flag indicating whether the file-cache is up-to-date or not.

path

The absolute path to the directory holding the source files.

verbose

A boolean flag indicating whether or not to be verbose.

Will get information from the config file by default.

Returns a tree on success, false on failure.

\$cb->__memory_save_source([verbose => BOOL, path => \$path])

This method saves all the parsed trees in *storabled* format if *Storable* is available.

It takes the following arguments:

path

The absolute path to the directory holding the source files.

verbose

A boolean flag indicating whether or not to be verbose.

Will get information from the config file by default.

Returns true on success, false on failure.
