

## NAME

TAP::Parser::Iterator::Stream - Internal TAP::Parser Iterator

## VERSION

Version 3.17

## SYNOPSIS

```
# see TAP::Parser::IteratorFactory for preferred usage

# to use directly:
use TAP::Parser::Iterator::Stream;
open( TEST, 'test.tap' );
my $it  = TAP::Parser::Iterator::Stream->new(\*TEST);
my $line = $it->next;
```

## DESCRIPTION

This is a simple iterator wrapper for reading from filehandles, used by *TAP::Parser*. Unless you're subclassing, you probably won't need to use this module directly.

## METHODS

### Class Methods

#### new

Create an iterator. Expects one argument containing a filehandle.

### Instance Methods

#### next

Iterate through it, of course.

#### next\_raw

Iterate raw input without applying any fixes for quirky input syntax.

#### wait

Get the wait status for this iterator. Always returns zero.

#### exit

Get the exit status for this iterator. Always returns zero.

## ATTRIBUTION

Originally ripped off from *Test::Harness*.
